

Version 1.0.2 | *Central Design System, Headless Backend & Multi-Platform SDK*

AmogDS (@amogads/ui) is the central design system and unified frontend/backend platform for Amoga. It is engineered to solve a common enterprise problem: fragmentation and duplication across web apps, mobile apps, and backend services.

- ****AmogDS acts as the Single Source of Truth**.**
- Any application (Next.js, React Web, React Native, Capacitor, Node.js Backend) imports pre-built UI components, full-page standard features, state stores, or serverless API handlers from `@amogads/ui``.

AmogDS is published and consumed as the @amogads/ui package with dedicated subpath exports:

Step 3.1: Installation

In your new Next.js project root:

```
npm install @amogads/ui
```

Step 3.2: Configure Styles (`globals.css`)

Import the AmogDS theme in your root app/globals.css or layout:

```
@import "tailwindcss";  
@import "@amogads/ui/theme.css";
```

Step 3.3: Embedding Standard Pages (Zero-Boilerplate)

To add full-fledged standard capabilities like Message / Mail, AI Chat, Vouchers, or Link Maker, simply create the page in your Next.js app directory:

```
// app/(dashboard)/message/page.tsx  
'use client'  
  
import { MessagePage } from '@amogads/ui/pages'  
  
export default function Page() {  
  return <MessagePage />  
}
```

```
// app/(dashboard)/ai_chat/page.tsx  
'use client'  
  
import { AiChatPage } from '@amogads/ui/pages'  
  
export default function Page() {  
  return <AiChatPage />  
}
```

```
// app/(dashboard)/vouchers/page.tsx  
'use client'  
  
import { VouchersPage } from '@amogads/ui/pages'  
  
export default function Page() {  
  return <VouchersPage />  
}
```

Step 3.4: Wiring Backend API Endpoints (2 Lines Each)

AmogDS includes complete backend logic. In your Next.js project, connect the standard API routes:

```
// app/api/messages/route.ts
import { handleMessagesGet, handleMessagesPost } from '@amogads/ui/server'

export const dynamic = 'force-dynamic'

export async function GET(request: Request) {
  return handleMessagesGet(request as any)
}

export async function POST(request: Request) {
  return handleMessagesPost(request as any)
}
```

```
// app/api/mail/inbox/route.ts
import { handleMailInboxGet } from '@amogads/ui/server'

export const dynamic = 'force-dynamic'

export async function GET(request: Request) {
  return handleMailInboxGet(request)
}
```

```
// app/api/vouchers/route.ts
import { handleVouchersGet, handleVouchersPost } from '@amogads/ui/server'

export const dynamic = 'force-dynamic'

export async function GET(request: Request) {
  return handleVouchersGet(request as any)
}

export async function POST(request: Request) {
  return handleVouchersPost(request as any)
}
```

4. Integrating with React Native (Mobile Apps)

AmogDS separates business logic, stores, services, and SDKs from DOM dependencies so mobile applications can reuse 100% of the state management and backend communication.

Step 4.1: Consuming Realtime Chat & Stores

In React Native:

```
import React, { useEffect } from 'react'
import { View, Text, FlatList, TextInput, TouchableOpacity } from 'react-native'
import { useChatStore, useNotificationStore } from '@amogads/ui/stores'
import { tokens } from '@amogads/ui/tokens'

export function MobileChatScreen({ userId, conversationId }: { userId: string; conversationId:
  const { messages, sendMessage, fetchMessages } = useChatStore()
  const { unreadCount } = useNotificationStore()

  useEffect(() => {
    fetchMessages(conversationId)
  }, [conversationId])

  return (
    <View style={{ flex: 1, backgroundColor: tokens.colors.background }}>
      <Text style={{ fontSize: tokens.typography.fontSize.lg, color: tokens.colors.foreground }}
        Chat ({unreadCount} unread notifications)
      </Text>

      <FlatList
        data={messages}
        keyExtractor={(item) => item.id}
        renderItem={({ item }) => (
          <View style={{ padding: tokens.spacing[2], marginVertical: tokens.spacing[1] }}>
            <Text style={{ color: tokens.colors.primary }}>{item.sender?.name}</Text>
            <Text>{item.message}</Text>
          </View>
        )}
      </FlatList>
    </View>
  )
}
```

Step 4.2: Using the Amoga SDK

```
import { AmogaChatSDK, AmogaVoucherSDK } from '@amogads/ui/sdk'

// Initialize SDK with your backend endpoint
const chatSDK = new AmogaChatSDK({ baseUrl: 'https://api.amoga.io' })
const voucherSDK = new AmogaVoucherSDK({ baseUrl: 'https://api.amoga.io' })

// Create a new voucher from mobile app
const voucher = await voucherSDK.createVoucher({
  code: 'SUMMER2026',
  amount: 25,
  currency: 'USD',
})
```

5. Summary of Standard Features Catalog

- Message & Email** (`@amogads/ui/pages -> <MessagePage />`):
 - Integrated Inbox & Sent mail viewer with live IMAP synchronization.
 - Rich TipTap email composer with file attachments and SMTP sending.
 - Contact and group management dialogs.
- AI Chat** (`@amogads/ui/pages -> <AiChatPage />`):
 - Streaming LLM conversations (OpenAI, Gemini, OpenRouter).
 - Conversation history, context switches, and prompt templates.

3. **AI Search** (`@amogads/ui/pages -> <AiSearchPage />`):
 - Tavily search integration with intelligent web summarization.
 - Source citations and deep link exploration.
4. **Vouchers** (`@amogads/ui/pages -> <VouchersPage />`):
 - Complete voucher issuing, code redemption, and balance management.
 - WooCommerce store integration and analytics.
5. **Link Maker** (`@amogads/ui/pages -> <LinkMakerPage />`):
 - Dynamic short URL generator, click analytics, and custom alias builder.
6. **Map Templates** (`@amogads/ui/pages -> <MapTemplatePage />`):
 - MapLibre GL geocoding, geolocation markers, and interactive route mapping.
